### RAINWATER STORAGE SOLUTIONS

#### WHAT MAKES OUR WATERBUTTS SO SPECIAL?

- All connections and taps are brass and not plastic .
- They are made with new, not recycled plastic, which means they last longer.
- They are made considerably thicker than cheaper alternatives, which not only makes them more durable, but is the only way to make the aesthetically pleasing variety of shapes & designs offered possible.
- Thinner/weaker plastic can only reproduce the more common, plain round shape seen in supermarkets everywhere. Using the 'blow moulded' process, instead of our rotation moulded process also inherently produces a shiny plastic surface and an unfinished roughness at the mould joints.
- Our 'rotation moulded' process, in contrast, mean the butts are created in one piece and hand finished to create a range of realistic textures, not a shiny, obviously plastic finish. For example, the terracotta style tank contains varying colour throughout, just as you would expect to see with a real terracotta urn and the wooden barrel finish 'looks' like wood. The colour is in the plastic throughout, to its full depth, so will not peel or fade.
- UV stable plastic is used so these tanks are fully UV resistant. No failure has been reported since the company began manufacturing in 2005 (plus this quality of plastic has been used without UV resistance failure for decades).

We have made the installation as simple as possible and each design comes with any tools required and full instructions.

- You may need to make the hole for the tap on some and others have an obvious flat area where the hole for the diverter pipe should be made. In this case a simple saw tool will be included.
- These instructions vary according to the water butt and the diverter chosen. You can request a copy of the relevant instructions on PDF before you place your order.
